

Display Modules

BDM 1000

CDM 4000

SDM 1000

SDM 1020

The most effective way to keep your packers informed and reduce packing errors.

Compac Display Modules Compac offers several rugged and robust models of display modules that can be mounted on Compac sorters or machines re-fit with Compac electronics. These modules provide your packing staff with useful information from the sorter control software, such as the size and grade of the fruit they are packing, to save time and reduce packing errors. When the sorter operator makes a change, the display modules are automatically up-dated so your packers are never in doubt of what they are packing.

Different models have been developed to best suit the application. So whether you are tray packing, volume filling or packing from rotary tables or bins, Compac has a solution.

CDM 4000 Series

Compac's CDM 4000 display module provides semi-automatic volume fill control or place packing to accurately weight fill cartons where a continuous flow of fruit is delivered from the sorter.

- Available in weighing and non-weighing models
- Free format message control of the displayed information such as size, grade, packaging type and identification, target fill weight, current weight in a carton, filling status as well as alerting staff when the carton is near full, full and over full
- Each CDM contains 4 lines of text with 20 characters per line
- Global text messaging capability (version 10 software required)
- Display in pounds or kilos
- Allows 2-way communication between sorter and packer

The weighing model is particularly suitable for tomato, nectarine, apricot or other fruit varieties where volume filling is utilised. Fruit can be held in a chute or on pack or rotary tables prior to being loaded into a carton.

BDM 1000 Series

Compac's BDM 1000 is a 6 character digital display. The large size of the characters makes it easy for your packing staff to read, even from across a room. The BDMs do away with the time-worn 'sticky notes', blackboard and chalk or taped pieces of paper that operators traditionally use to update packers working around their sorter.

- Available in single-sided and double-sided models
- Displays reduce errors and remove guesswork by your packing staff
- Displays update immediately when the sorter operator makes a change
- Global text messaging capability (version 10 software required)
- Can display more than one size/grade of fruit being delivered to an individual outlet

These units are particularly useful where you may use tray fillers or demand feed belts for apples, stone fruit, kiwifruit, citrus, potatoes, onions, etc.

SDM 1000 Series

Compac Sorting Equipment's SDM 1000 and SDM 1020 displays are designed specially for packers who want to reduce packing errors, save time and increase communication to packers around your machine where rotary tables, packing tables and bagging outlets are utilised.

- Free format message control of the displayed information such as size, grade, packaging type and identification
- Each SDM contains 4 lines of text with 20 characters per line
- Global text messaging capability messages will alternate with the pack information shown and the large yellow light will flash to alert packers of the message (version 10 software required)
- Allows 2-way communication between sorter and packer
